Updated:	10/03/2010	Due date:
Subject:		Torrent.Client.ConnectionManager.TryConnect()
Description:	Repro steps:	
	# Add several torrents to a @ClientEngine@.	
	# Start one. # Wait for it to finish. # Stop it. # Remove it from the @ClientEngine@. # Start another one. (crash)	
	It's a little timing sensitive, but not too hard to reproduce. The issue is that @TryConnectIndex@ ends up out past the number of @TorrentManagers@ in the @ClientEngine@, causing the second loop in @ConnectionManager.TryConnect()@ to blow up. Suggested replacement for both loops:	
	<pre><pre></pre> // Check each torrent manager in turn to see if they have any peers we want to connect to int count = engine.Torrents.Count; if(count > 0) //gonna do some modulo madness {</pre>	
	//wrap the index in case torrents have been	
//removed between the last connect and now		now (yes, it happens)
	int startIndex = TryConnectIndex % count;	
	int i = startIndex;	
	do {	
if(TryConnect(engine.Torrents[i]))		
	{	
	TryConnectIndex = i + 1;	
	break;	
	}	
	i = (i + 1) % count; //wrap around the list	
	} while(i != startIndex); //ending when we	e reach the first one we tried to connect to
	}	
		ctly once, starting at @TryConnectIndex@, and maintain the old @ to point to the element after the first that successfully made a

This seems to have been fixed as part of a different change.

(is anyone even watching this site?)
