Implemented filters feature. (closes: #86)

Messages and events can be filtered by specifying rules that can match the protocol, chat type, chat id / name, message type, and message pattern. Empty fields are wildcards and match all values.

Chat id / name and message pattern support globbing by using the '*' character as the leading and/or trailing character, e.g.: *foobar or *foobar*. Regex can be used by surrounding the pattern with the '/' character, e.g: /foo(bar)?/ Message patterns default to use wildcards if none are specified.

Thats a missing feature, not implemented yet.

Would be awesome to see this.

I think it is a very important feature to make the client more useable. I stay in 10> channels on freenode, mostly big ones. This make the highlighting in the channel tab very useless since many channel actions are quits/exits/parts/joins, which I would love to filter out.

Great work.
