Subject:	TorrentManager.Stop() seems to be asynchronous		

Description:	I'm trying to download a file from a multi-file torrent using MonoTorrent. I set the priority of the file to Immediate while all other files are Do Not Download. I monitor the file progress, and once it reaches 100%, I call:
	
	torrentManager.Stop();
	torrentEngine.Unregister(torrentManager);
	
	The second line throws an exception:
	Exception in mainloop
	The manager must be stopped before it can be unregistered
	at MonoTorrent.Client.MainLoop.QueueWait(DelegateTask t)
	at MonoTorrent.Client.MainLoop.QueueWait(MainLoopTask task)
	at MonoTorrent.Client.ClientEngine.Unregister(TorrentManager manager)
	
	Is there a way to synchronously stop a torrent manager, so I can unregister it?

Forgot to mention:

This happens in MonoTorrent v0.80, release build.

The following workaround seems to work at simulating Stop function being synchronous:

This is part of the function where you want to stop and unload the manager:

torrentManager.TorrentStateChanged += new EventHandler<TorrentStateChangedEventArgs>(torrentManager_TorrentStateChanged);

torrentManager.Stop();
lock (ManagerUnloadedLock)
{
    Monitor.Wait(ManagerUnloadedLock);
}

This is the event handler:

private object ManagerUnloadedLock = new object();
void torrentManager_TorrentStateChanged(object sender, TorrentStateChangedEventArgs e)
{
    if (e.NewState == TorrentState.Stopped)
    {
        try
        {
            torrentEngine.Unregister(e.TorrentManager);
            e.TorrentManager.Dispose();
        }

```
        catch (Exception ex)

        {

            //handle exception here, shouldnt really happen

        }

        finally

        {

            lock (ManagerUnloadedLock)

            {

                Monitor.Pulse(ManagerUnloadedLock);

            }

        }

    }

        }

            }
```

- Status changed from New to Rejected

It's asynchronous because several long-lasting tasks need to be performed when you stop a torrent. That's why the manager goes from Active -> Stopping and then from Stopping -> Stopped once those tasks have completed. These tasks can take up to 30 seconds to complete. I don't think making 'Stop' synchronous would be a good solution as the common usage of it would be to call it from a UI event and that would make the common usage block the calling application for a long period of time.
